The Internet is the largest networking platform in the world. There are many connections from all over the world that we do not know clearly about, and there are also fake sources that can have a very negative effect in life of people all over the world.

When we connect our lives to the Internet, of course, it is like risking our lives, because our data is so valuable and so important that

all the scammers on the internet want. All these negative effects have a very negative impact on our daily lives.

Phishing: phishing is a cybercrime using strategies such as fake emails, websites and SMS to trick victims into giving out personal information such as address, date of birth, name, password, insurance and credit card number. And so on. Then perpetrator pretends to be the victim and uses this information to apply for a cash loan license in a bank account or can apply for a loan.

A virus is a collection of code created by cybercriminals for damaging data and systems or for unauthorized access to a network. These viruses are usually distributed in the form of links or files. On the email and log into the victim's system when the victim clicks on the link or opens the file
